CampusFlow LMS

System status, feature overview and an easy demo guide

Report date: 31 October 2026

CampusFlow is a full-stack student management and learning platform with online courses, community features and KHQR payments.

Frontend

HTTP 200 Railway online

Backend API

Health HTTP 200 Connected

Course catalog

HTTP 200 2 courses available

Overall result: ready for a normal product demonstration. The public frontend, backend API, course catalog and security controls are online.

1. Live system status

Component	Live address or check	Result
Frontend custom domain	https://campusflowlms.xyz	HTTP 200; SSL active
Frontend Railway origin	https://frontend-production-85134.up.railway.app	HTTP 200
Backend API	https://schoolmanagement-production-d78b.up.railway.app/health	HTTP 200
Course catalog	/storefront/courses	HTTP 200; 2 courses
Frontend asset	/assets/index-D27Ggyei.js	HTTP 200
Hosting	Railway with campusflowlms.xyz	Online

Recommended demo URL: https://campusflowlms.xyz. The Railway URL is the deployment origin. The www hostname needs separate HTTPS configuration if https://www.campusflowlms.xyz is required.

2. Main system features

- Student, teacher, customer and administrator accounts.
- Email/password login and Google sign-in for supported roles.
- Course catalog, course details and protected course access.
- Real Bakong/KHQR registration and course payments with backend verification.
- Student dashboard, assignments, homework submissions, grades, exams and certificates.
- Teacher courses, schedules, attendance, assignments, submissions and announcements.
- Administrator users, permissions, students, teachers, courses, enrollments and settings.
- Community posts, image/video media, stories, friends, groups, chat and notifications.
- English and Khmer language support plus light/dark theme.

3. Technology and data flow

Browser	React + Vite frontend	NestJS REST API	PostgreSQL
User opens the Railway website.	Displays courses, dashboards and community pages.	Handles JWT, roles, payments and business rules.	Stores users, courses, enrollments and payment records.

External services: Firebase Authentication for Google sign-in, Bakong Open API for payment verification, and Telegram notifications when configured.

4. Simple demo steps

Public visitor demo

- Open https://campusflowlms.xyz.
- Show the home page and open /courses.
- Select a course and show its description, teacher and price.
- Open /community to show public posts and community members.

Student demo

- Open /login/student and sign in using a private demo student account or Google sign-in.
- Open Student -> Courses and choose a course.
- Click Buy course to display a fresh KHQR and invoice amount.
- For a real payment demonstration, scan with ABA or Bakong, confirm the amount, then wait for verification.
- After success, open the course and show assignments, schedule and learning progress.

Teacher demo

- Open /login/teacher.
- Show the dashboard and assigned courses.
- Open attendance, assignments, submissions, grades, schedule and announcements.
- Create or edit records only in a demo environment.

Administrator demo

- Open /login/admin.
- Show students, teachers, courses, users and permissions.
- Show enrollments, schedules, attendance, announcements and certificates.
- Show Telegram and system settings without displaying tokens or passwords.

5. Payment demonstration

Safe payment demo

Use a fresh QR. QR codes expire after the configured payment window. Check the recipient and amount in ABA/Bakong before confirming. Never make multiple payments if one payment is already pending or the money has been deducted.

- QR generation is handled by the backend and rendered sharply by the frontend.
- The backend checks the invoice amount, currency, destination account and Bakong response.
- A frontend screenshot cannot mark a payment as paid.
- A complete end-to-end paid test requires a signed-in student and a user-controlled ABA/Bakong confirmation.

6. Security status

- HTTPS is enabled on the live frontend and backend.
- Frontend security headers include CSP, HSTS and X-Frame-Options: DENY.
- Backend security headers include X-Frame-Options: DENY and a restrictive Permissions Policy.
- Unauthenticated checkout and course-payment access are rejected with HTTP 401.
- Unknown payment tokens return HTTP 404.
- Authentication, rate limiting, CORS, request validation and role permissions are enabled.

7. Demo safety rules

- Never put passwords, JWT secrets, Firebase private keys, database passwords, Bakong tokens or Telegram bot tokens in slides or screenshots.
- Use separate demo accounts and a separate demo database when possible.
- Do not run database seed commands on the production database.
- Keep Railway, Firebase, GitHub, email and domain accounts protected with 2FA.

Prepared for easy product demonstration. Live checks were read-only and did not transfer money.
